

# Logic Agents and Propositional Logic

**CHAPTER 7**  
**HASSAN KHOSRAVI**  
**SPRING2011**

# Knowledge-Based Agents

- **KB = knowledge base**
  - A set of sentences or facts
  - e.g., a set of statements in a logic language
- **Inference**
  - Deriving new sentences from old
  - e.g., using a set of logical statements to infer new ones
- **A simple model for reasoning**
  - Agent is told or perceives new evidence
    - ✦ E.g., A is true
  - Agent then infers new facts to add to the KB
    - ✦ E.g.,  $KB = \{ A \rightarrow (B \text{ OR } C) \}$ , then given A and not C we can infer that B is true
    - ✦ B is now added to the KB even though it was not explicitly asserted, i.e., the agent inferred B

# Wumpus World

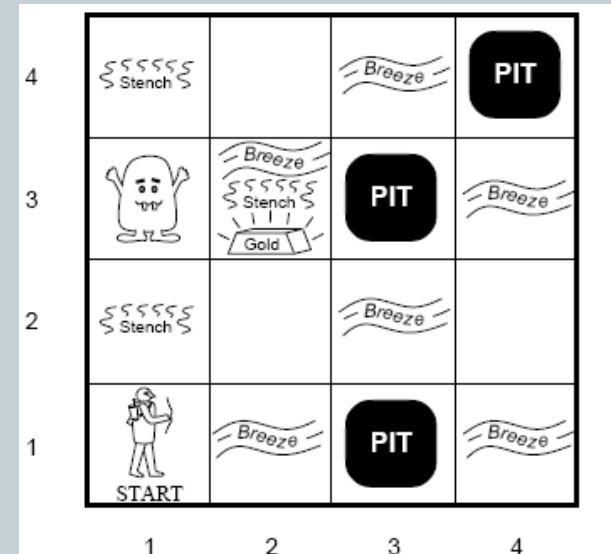

- Environment

- Cave of 4×4

- Agent enters in [1,1]

- 16 rooms

- ✦ Wumpus: A deadly beast who kills anyone entering his room.
- ✦ Pits: Bottomless pits that will trap you forever.
- ✦ Gold

# Wumpus World

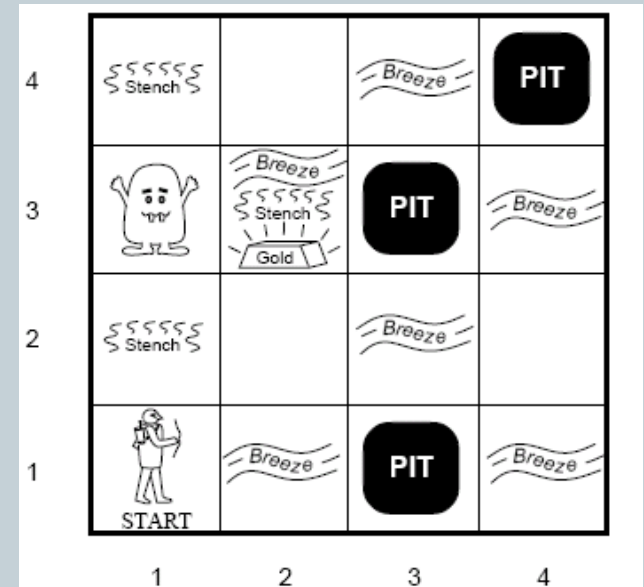

- **Agents Sensors:**

- Stench next to Wumpus
- Breeze next to pit
- Glitter in square with gold
- Bump when agent moves into a wall
- Scream from wumpus when killed

- **Agents actions**

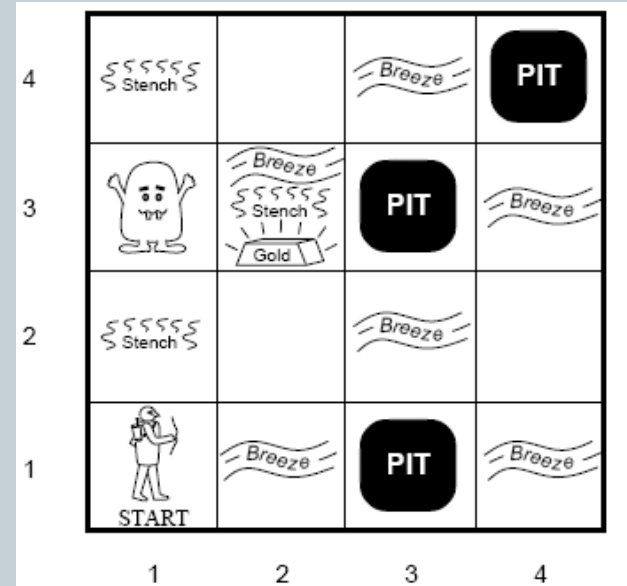

- Agent can move forward, turn left or turn right
- Shoot, one shot

# Wumpus World

- Performance measure
  - +1000 for picking up gold
  - -1000 got falling into pit
  - -1 for each move
  - -10 for using arrow

# Reasoning in the Wumpus World

- Agent has initial ignorance about the configuration
  - Agent knows his/her initial location
  - Agent knows the rules of the environment
- Goal is to explore environment, make inferences (reasoning) to try to find the gold.
- Random instantiations of this problem used to test agent reasoning and decision algorithms

(applications? “intelligent agents” in computer games)

# Exploring the Wumpus World

1,4	2,4	3,4	4,4
1,3	2,3	3,3	4,3
1,2	2,2	3,2	4,2
OK A OK	OK		

**A** = Agent  
**B** = Breeze

1,2 S V OK	2,2 V OK	3,2	4,2
1,1 V OK	2,1 B V OK	3,1 P!	4,1

(b)

[2,2] move to [2,3]

[2,3] detect glitter , smell, breeze  
 THUS pick up gold  
 THUS pit in [3,3] or [2,4]

# What our example has shown us

- Can represent general knowledge about an environment by a set of rules and facts
- Can gather evidence and then infer new facts by combining evidence with the rules
- The conclusions are guaranteed to be correct if
  - The evidence is correct
  - The rules are correct
  - The inference procedure is correct
    - > logical reasoning
- The inference may be quite complex
  - E.g., evidence at different times, combined with different rules, etc

# What is a Logic?

- A formal language
  - KB = set of sentences
- Syntax
  - what sentences are legal (well-formed)
  - E.g., arithmetic
    - ✦  $X+2 \geq y$  is a wf sentence,  $+x2y$  is not a wf sentence
- Semantics
  - loose meaning: the interpretation of each sentence
  - More precisely:
    - ✦ Defines the truth of each sentence wrt to each possible world
  - e.g.,
    - ✦  $X+2 = y$  is true in a world where  $x=7$  and  $y =9$
    - ✦  $X+2 = y$  is false in a world where  $x=7$  and  $y =1$
  - Note: standard logic – each sentence is T of F wrt eachworld
    - ✦ Fuzzy logic – allows for degrees of truth.

# Models and possible worlds

- Logicians typically think in terms of models, which are formally structured worlds with respect to which truth can be evaluated.
- $m$  is a model of a sentence  $\alpha$  if  $\alpha$  is true in  $m$
- $M(\alpha)$  is the set of all models of  $\alpha$
- Possible worlds ~ models
  - Possible worlds: potentially real environments
  - Models: mathematical abstractions that establish the truth or falsity of every sentence
- Example:
  - $x + y = 4$ , where  $x = \#men$ ,  $y = \#women$
  - Possible models = all possible assignments of integers to  $x$  and  $y$

# Entailment

- One sentence follows logically from another

$$\alpha \models \beta$$

$\alpha$  entails sentence  $\beta$  *if and only if*  $\beta$  is true in all worlds where  $\alpha$  is true.

$$\text{e.g., } x+y=4 \models 4=x+y$$

- Entailment is a relationship between sentences that is based on semantics.

# Entailment in the wumpus world

- Consider possible models for *KB* assuming only pits and a reduced Wumpus world
- Situation after detecting nothing in [1,1], moving right, detecting breeze in [2,1]

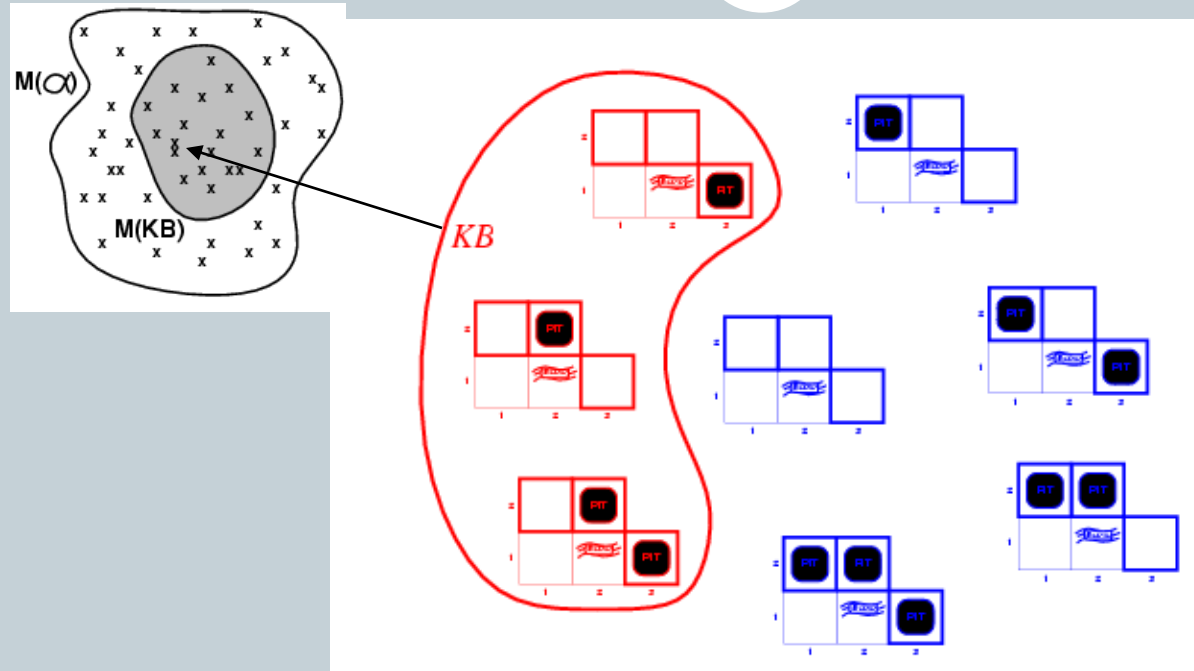

# Wumpus models

All possible models in this reduced Wumpus world.

# Wumpus models

- $KB$  = all possible wumpus-worlds consistent with the observations and the “physics” of the Wumpus world.

# Inferring conclusions

- Consider 2 possible conclusions given a KB
  - $\alpha_1 = "[1,2] \text{ is safe}"$
  - $\alpha_2 = "[2,2] \text{ is safe}"$
- One possible inference procedure
  - Start with KB
  - Model-checking
    - ✦ Check if  $\text{KB} \models \alpha$  by checking if in all possible models where KB is true that  $\alpha$  is also true
- Comments:
  - Model-checking enumerates all possible worlds
    - ✦ Only works on finite domains, will suffer from exponential growth of possible models

# Wumpus models

$\alpha_1 = "[1,2] \text{ is safe} ", KB \models \alpha_1$ , proved by **model checking**

# Wumpus models

$\alpha_2 = "[2,2] \text{ is safe} ", \cancel{KB} \models \alpha_2$

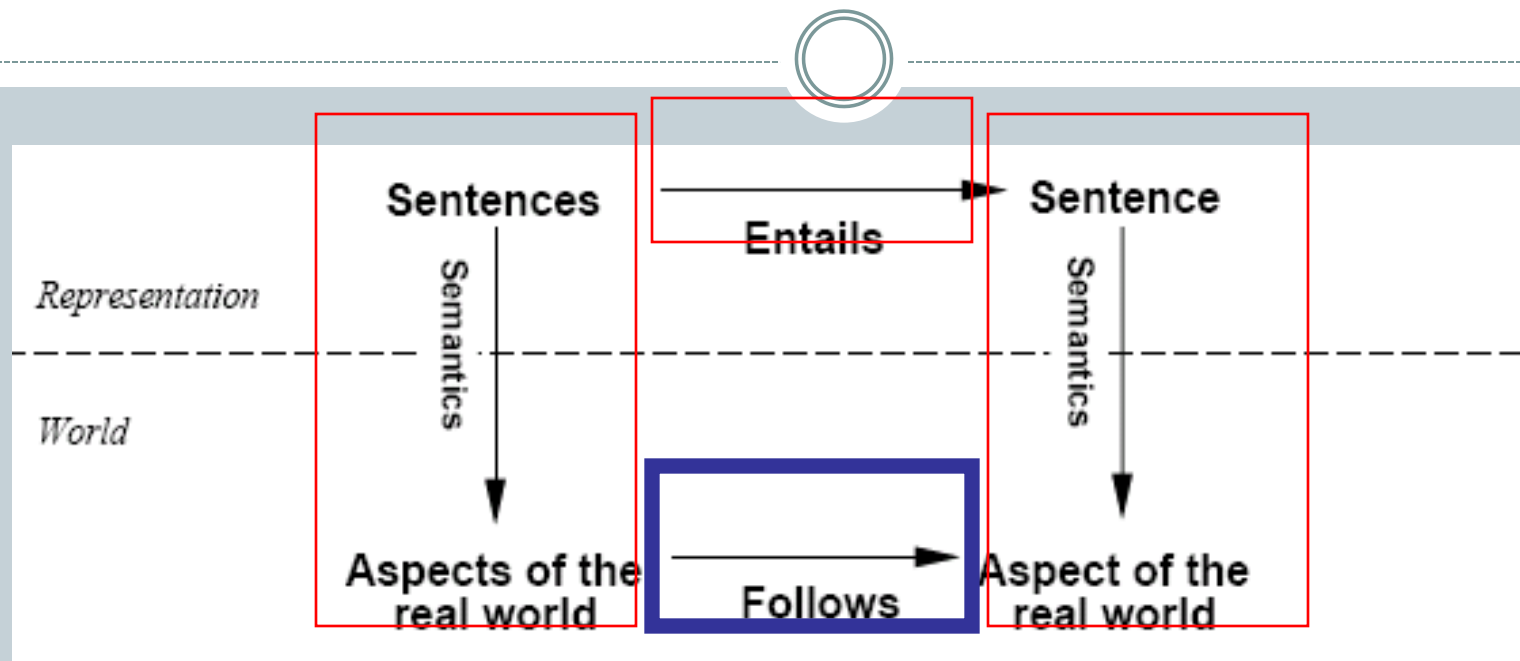

There are some models entailed by KB where  $\alpha_2$  is false

# Logical inference

- The notion of entailment can be used for logic inference.
  - Model checking (see wumpus example): enumerate all possible models and check whether  $\alpha$  is true.
- If an algorithm only derives entailed sentences it is called *sound* or *truth preserving*.
  - Otherwise it just makes things up.  
 *$i$  is sound if whenever  $KB \models_i \alpha$  it is also true that  $KB \models \alpha$*
  - *E.g., model-checking is sound*
- **Completeness** : the algorithm can derive any sentence that is entailed.  
 *$i$  is complete if whenever  $KB \models \alpha$  it is also true that  $KB \models_i \alpha$*

# Schematic perspective

*If KB is true in the real world, then any sentence  $\alpha$  derived from KB by a sound inference procedure is also true in the real world.*

# Propositional logic: **Syntax**

- Propositional logic is the simplest logic – illustrates basic ideas
- Atomic sentences = single proposition symbols
  - E.g., P, Q, R
  - Special cases: True = always true, False = always false
- Complex sentences:
  - If S is a sentence,  $\neg S$  is a sentence (**negation**)
  - If  $S_1$  and  $S_2$  are sentences,  $S_1 \wedge S_2$  is a sentence (**conjunction**)
  - If  $S_1$  and  $S_2$  are sentences,  $S_1 \vee S_2$  is a sentence (**disjunction**)
  - If  $S_1$  and  $S_2$  are sentences,  $S_1 \Rightarrow S_2$  is a sentence (**implication**)
  - If  $S_1$  and  $S_2$  are sentences,  $S_1 \Leftrightarrow S_2$  is a sentence (**biconditional**)

# Propositional logic: Semantics

Each model/world specifies true or false for each proposition symbol

E.g.  $P_{1,2}$  false     $P_{2,2}$  true     $P_{3,1}$  false

With these symbols, 8 possible models, can be enumerated automatically.

Rules for evaluating truth with respect to a model  $m$ :

$\neg S$  is true iff  $S$  is false

$S_1 \wedge S_2$  is true iff  $S_1$  is true **and**  $S_2$  is true

$S_1 \vee S_2$  is true iff  $S_1$  is true **or**  $S_2$  is true

$S_1 \Rightarrow S_2$  is true iff  $S_1$  is false **or**  $S_2$  is true  
i.e., is false iff  $S_1$  is true **and**  $S_2$  is false

$S_1 \Leftrightarrow S_2$  is true iff  $S_1 \Rightarrow S_2$  is true **and**  $S_2 \Rightarrow S_1$  is true

Simple recursive process evaluates an arbitrary sentence, e.g.,

$$\neg P_{1,2} \wedge (P_{2,2} \vee P_{3,1}) = \text{true} \wedge (\text{true} \vee \text{false}) = \text{true} \wedge \text{true} = \text{true}$$

# Truth tables for connectives

$P$	$Q$	$\neg P$	$P \wedge Q$	$P \vee Q$	$P \Rightarrow Q$	$P \Leftrightarrow Q$
<i>false</i>	<i>false</i>	<i>true</i>	<i>false</i>	<i>false</i>	<i>true</i>	<i>true</i>
<i>false</i>	<i>true</i>	<i>true</i>	<i>false</i>	<i>true</i>	<i>true</i>	<i>false</i>
<i>true</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>true</i>	<i>false</i>	<i>false</i>
<i>true</i>	<i>true</i>	<i>false</i>	<i>true</i>	<i>true</i>	<i>true</i>	<i>true</i>

# Truth tables for connectives

$P$	$Q$	$\neg P$	$P \wedge Q$	$P \vee Q$	$P \Rightarrow Q$	$P \Leftrightarrow Q$
<i>false</i>	<i>false</i>	<i>true</i>	<i>false</i>	<i>false</i>	<i>true</i>	<i>true</i>
<i>false</i>	<i>true</i>	<i>true</i>	<i>false</i>	<i>true</i>	<i>true</i>	<i>false</i>
<i>true</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>true</i>	<i>false</i>	<i>false</i>
<i>true</i>	<i>true</i>	<i>false</i>	<i>true</i>	<i>true</i>	<i>true</i>	<i>true</i>

**Implication is always true  
when the premise is false**

**Why?  $P \Rightarrow Q$  means “if  $P$  is true then I am claiming that  $Q$  is true  
otherwise no claim”**

**Only way for this to be false is if  $P$  is true and  $Q$  is false**

# Wumpus world sentences

Let  $P_{i,j}$  be true if there is a pit in  $[i, j]$ .

Let  $B_{i,j}$  be true if there is a breeze in  $[i, j]$ .

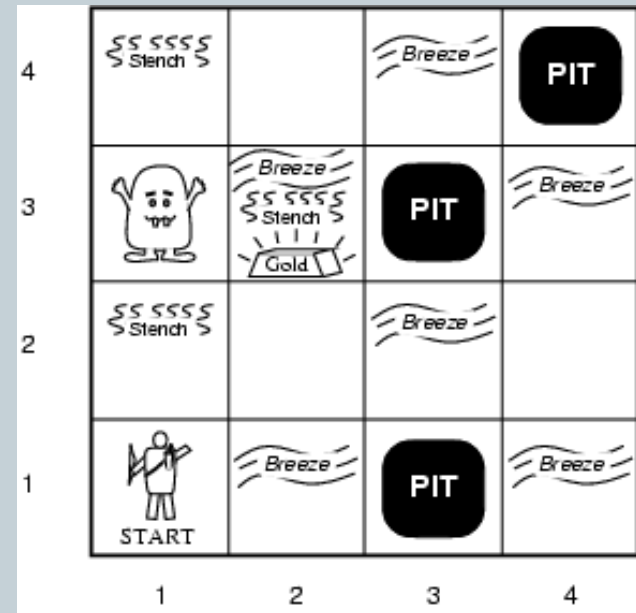

start:  $\neg P_{1,1}$

$\neg B_{1,1}$   
 $B_{2,1}$

- "Pits cause breezes in adjacent squares"

$B_{1,1} \Leftrightarrow (P_{1,2} \vee P_{2,1})$

$B_{2,1} \Leftrightarrow (P_{1,1} \vee P_{2,2} \vee P_{3,1})$

- KB can be expressed as the conjunction of all of these sentences
- Note that these sentences are rather long-winded!
  - E.g., breeze “rule” must be stated explicitly for each square
  - First-order logic will allow us to define more general relations (later)

# Truth tables for the Wumpus KB

$B_{1,1}$	$B_{2,1}$	$P_{1,1}$	$P_{1,2}$	$P_{2,1}$	$P_{2,2}$	$P_{3,1}$	$KB$	$\alpha_1$
<i>false</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>true</i>
<i>false</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>true</i>	<i>false</i>	<i>true</i>
$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$
<i>false</i>	<i>true</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>true</i>
<i>false</i>	<i>true</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>true</i>	<u><i>true</i></u>	<u><i>true</i></u>
<i>false</i>	<i>true</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>true</i>	<i>false</i>	<u><i>true</i></u>	<u><i>true</i></u>
<i>false</i>	<i>true</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>true</i>	<i>true</i>	<u><i>true</i></u>	<u><i>true</i></u>
<i>false</i>	<i>true</i>	<i>false</i>	<i>false</i>	<i>true</i>	<i>false</i>	<i>false</i>	<i>false</i>	<i>true</i>
$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$	$\vdots$
<i>true</i>	<i>true</i>	<i>true</i>	<i>true</i>	<i>true</i>	<i>true</i>	<i>true</i>	<i>false</i>	<i>false</i>

# Inference by enumeration

- We want to see if  $\alpha$  is entailed by KB
- Enumeration of all models is sound and complete.
- But...for  $n$  symbols, time complexity is  $O(2^n)$ ...
- We need a more efficient way to do inference
  - But worst-case complexity will remain exponential for propositional logic

# Logical equivalence

- To manipulate logical sentences we need some rewrite rules.
- Two sentences are **logically equivalent** iff they are true in same models:  $\alpha \equiv \beta$  iff  $\alpha \models \beta$  and  $\beta \models \alpha$

$$(\alpha \wedge \beta) \equiv (\beta \wedge \alpha) \quad \text{commutativity of } \wedge$$

$$(\alpha \vee \beta) \equiv (\beta \vee \alpha) \quad \text{commutativity of } \vee$$

$$((\alpha \wedge \beta) \wedge \gamma) \equiv (\alpha \wedge (\beta \wedge \gamma)) \quad \text{associativity of } \wedge$$

$$((\alpha \vee \beta) \vee \gamma) \equiv (\alpha \vee (\beta \vee \gamma)) \quad \text{associativity of } \vee$$

$$\neg(\neg\alpha) \equiv \alpha \quad \text{double-negation elimination}$$

$$(\alpha \Rightarrow \beta) \equiv (\neg\beta \Rightarrow \neg\alpha) \quad \text{contraposition}$$

$$(\alpha \Rightarrow \beta) \equiv (\neg\alpha \vee \beta) \quad \text{implication elimination}$$

$$(\alpha \Leftrightarrow \beta) \equiv ((\alpha \Rightarrow \beta) \wedge (\beta \Rightarrow \alpha)) \quad \text{biconditional elimination}$$

$$\neg(\alpha \wedge \beta) \equiv (\neg\alpha \vee \neg\beta) \quad \text{de Morgan}$$

$$\neg(\alpha \vee \beta) \equiv (\neg\alpha \wedge \neg\beta) \quad \text{de Morgan}$$

$$(\alpha \wedge (\beta \vee \gamma)) \equiv ((\alpha \wedge \beta) \vee (\alpha \wedge \gamma)) \quad \text{distributivity of } \wedge \text{ over } \vee$$

$$(\alpha \vee (\beta \wedge \gamma)) \equiv ((\alpha \vee \beta) \wedge (\alpha \vee \gamma)) \quad \text{distributivity of } \vee \text{ over } \wedge$$

- Modus Ponens

$$\frac{\alpha \Rightarrow \beta, \quad \alpha}{\beta}$$

- And-Elimination

$$\frac{\alpha \wedge \beta}{\alpha}$$

- Bi-conditional Elimination

$$\frac{\alpha \Leftrightarrow \beta}{(\alpha \Rightarrow \beta) \wedge (\beta \Rightarrow \alpha)} \quad \text{and} \quad \frac{(\alpha \Rightarrow \beta) \wedge (\beta \Rightarrow \alpha)}{\alpha \Leftrightarrow \beta}$$

# Validity and satisfiability

A sentence is **valid** if it is true in **all** models,  
e.g., *True*,  $A \vee \neg A$ ,  $A \Rightarrow A$ ,  $(A \wedge (A \Rightarrow B)) \Rightarrow B$   
(tautologies)

Validity is connected to inference via the **Deduction Theorem**:  
 $KB \models \alpha$  if and only if  $(KB \Rightarrow \alpha)$  is valid

A sentence is **satisfiable** if it is true in **some** model  
e.g.,  $A \vee B$ ,  $C$   
(determining satisfiability of sentences is NP-complete)

A sentence is **unsatisfiable** if it is false in **all** models  
e.g.,  $A \wedge \neg A$

Satisfiability is connected to inference via the following:  
 $KB \models \alpha$  if and only if  $(KB \wedge \neg \alpha)$  is unsatisfiable  
(there is no model for which  $KB = \text{true}$  and  $\alpha$  is false)  
(aka proof by contradiction: assume  $\alpha$  to be false and this leads to contradictions in KB)

# Proof methods

- Proof methods divide into (roughly) two kinds:

## Application of inference rules:

Legitimate (sound) generation of new sentences from old.

- ✦ Resolution
- ✦ Forward & Backward chaining

## Model checking

Searching through truth assignments.

- ✦ Improved backtracking: Davis--Putnam-Logemann-Loveland (DPLL)
- ✦ Heuristic search in model space: Walksat.

# Normal Form

We want to prove:

$$KB \models \alpha$$

equivalent to:  $KB \wedge \neg\alpha$  unsatisfiable

We first rewrite  $KB \wedge \neg\alpha$  into **conjunctive normal form (CNF)**.

A “conjunction of disjunctions”

$$(A \vee \neg B) \wedge (B \vee \neg C \vee \neg D)$$

Clause

Clause

literals

- Any KB can be converted into CNF
- k-CNF: exactly k literals per clause

# Example: Conversion to CNF

$$B_{1,1} \Leftrightarrow (P_{1,2} \vee P_{2,1})$$

1. Eliminate  $\Leftrightarrow$ , replacing  $\alpha \Leftrightarrow \beta$  with  $(\alpha \Rightarrow \beta) \wedge (\beta \Rightarrow \alpha)$ .  
 $(B_{1,1} \Rightarrow (P_{1,2} \vee P_{2,1})) \wedge ((P_{1,2} \vee P_{2,1}) \Rightarrow B_{1,1})$
2. Eliminate  $\Rightarrow$ , replacing  $\alpha \Rightarrow \beta$  with  $\neg\alpha \vee \beta$ .  
 $(\neg B_{1,1} \vee P_{1,2} \vee P_{2,1}) \wedge (\neg(P_{1,2} \vee P_{2,1}) \vee B_{1,1})$
3. Move  $\neg$  inwards using de Morgan's rules and double-negation:  
 $(\neg B_{1,1} \vee P_{1,2} \vee P_{2,1}) \wedge ((\neg P_{1,2} \wedge \neg P_{2,1}) \vee B_{1,1})$
4. Apply distributive law ( $\wedge$  over  $\vee$ ) and flatten:  
 $(\neg B_{1,1} \vee P_{1,2} \vee P_{2,1}) \wedge (\neg P_{1,2} \vee B_{1,1}) \wedge (\neg P_{2,1} \vee B_{1,1})$

# Resolution Inference Rule for CNF

$(A \vee B \vee C)$

$(\neg A)$

-----  
 $\therefore (B \vee C)$

“If A or B or C is true, but not A, then B or C must be true.”

$(A \vee B \vee C)$

$(\neg A \vee D \vee E)$

-----  
 $\therefore (B \vee C \vee D \vee E)$

“If A is false then B or C must be true, or if A is true then D or E must be true, hence since A is either true or false, B or C or D or E must be true.”

$(A \vee B)$

$(\neg A \vee B)$

-----  
 $\therefore (B \vee B) \equiv B$

← Simplification

# Resolution Algorithm

- The resolution algorithm tries to prove:  $KB \models \alpha$  equivalent to  $KB \wedge \neg\alpha$  unsatisfiable
- Generate all new sentences from KB and the query.
- One of two things can happen:
  1. We find  $P \wedge \neg P$  which is unsatisfiable, i.e. we can entail the query.
  2. We find no contradiction: there is a model that satisfies the Sentence (non-trivial) and hence we cannot entail the query.

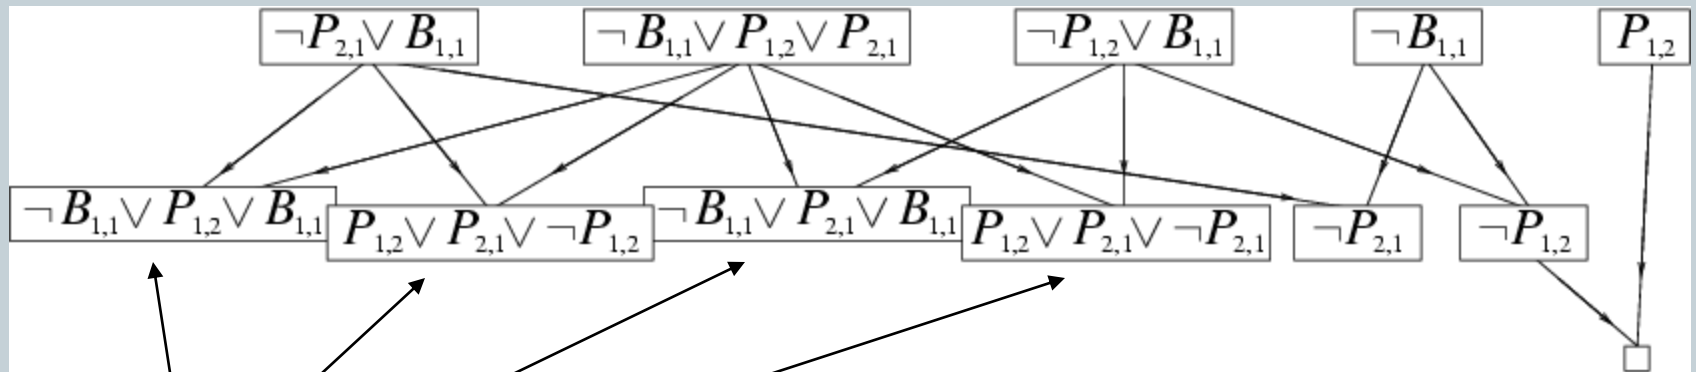

$$KB \wedge \neg\alpha$$

# Resolution example

- $KB = (B_{1,1} \Leftrightarrow (P_{1,2} \vee P_{2,1})) \wedge \neg B_{1,1}$
- $\alpha = \neg P_{1,2}$

$$KB \wedge \neg \alpha$$

True

False in all worlds

# Horn Clauses

- Resolution in general can be exponential in space and time.
- If we can reduce all clauses to “Horn clauses” resolution is linear in space and time

A clause with at most 1 positive literal.

e.g.  $A \vee \neg B \vee \neg C$

- Every Horn clause can be rewritten as an implication with a conjunction of positive literals in the premises and a single positive literal as a conclusion.

e.g.  $B \wedge C \Rightarrow A$

- 1 positive literal: definite clause
- 0 positive literals: Fact or integrity constraint:  
e.g.  $(\neg A \vee \neg B) \equiv (A \wedge B \Rightarrow \text{False})$

# Forward-chaining pseudocode

**function** PL-FC-ENTAILS?(*KB, q*) *returns true or false*

**local variables:** *count*, a table, indexed by clause, initially the number of premises  
*inferred*, a table, indexed by symbol, each entry initially *false*  
*agenda*, a list of symbols, initially the symbols known to be true

**while** *agenda* is not empty **do**

$p \leftarrow \text{POP}(\textit{agenda})$

**unless** *inferred*[*p*] **do**

$\textit{inferred}[p] \leftarrow \textit{true}$

**for each** Horn clause *c* in whose premise *p* appears **do**

            decrement *count*[*c*]

**if** *count*[*c*] = 0 **then do**

**if** HEAD[*c*] = *q* **then return true**

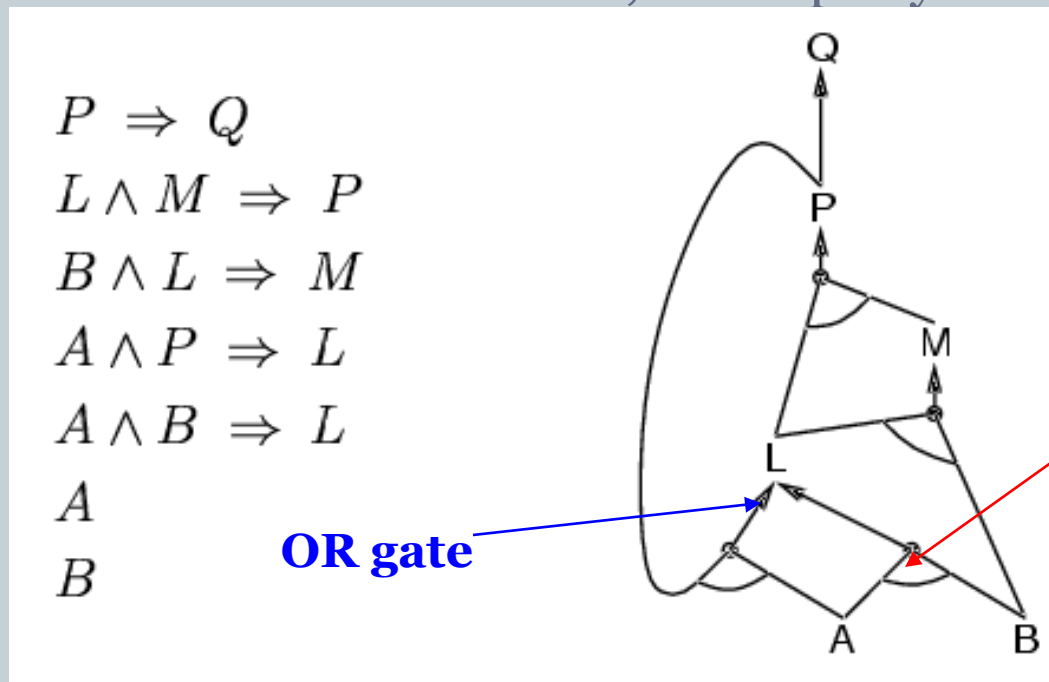

                PUSH(HEAD[*c*], *agenda*)

**return false**

# Forward chaining: graph representation

- Idea: fire any rule whose premises are satisfied in the *KB*,
  - add its conclusion to the *KB*, until query is found

- Forward chaining is sound and complete for Horn KB

# Forward chaining example

“OR” Gate

“AND” gate

# Forward chaining example

# Forward chaining example

# Forward chaining example

# Forward chaining example

# Forward chaining example

# Forward chaining example

# Forward chaining

- FC is **data-driven**, automatic, unconscious processing,
  - e.g., object recognition, routine decisions
- May do lots of work that is irrelevant to the goal

# Backward chaining

Idea: work backwards from the query  $q$

- ✦ check if  $q$  is known already, or
- ✦ prove by BC all premises of some rule concluding  $q$
- ✦ Hence BC maintains a stack of sub-goals that need to be proved to get to  $q$ .

# Backward chaining example

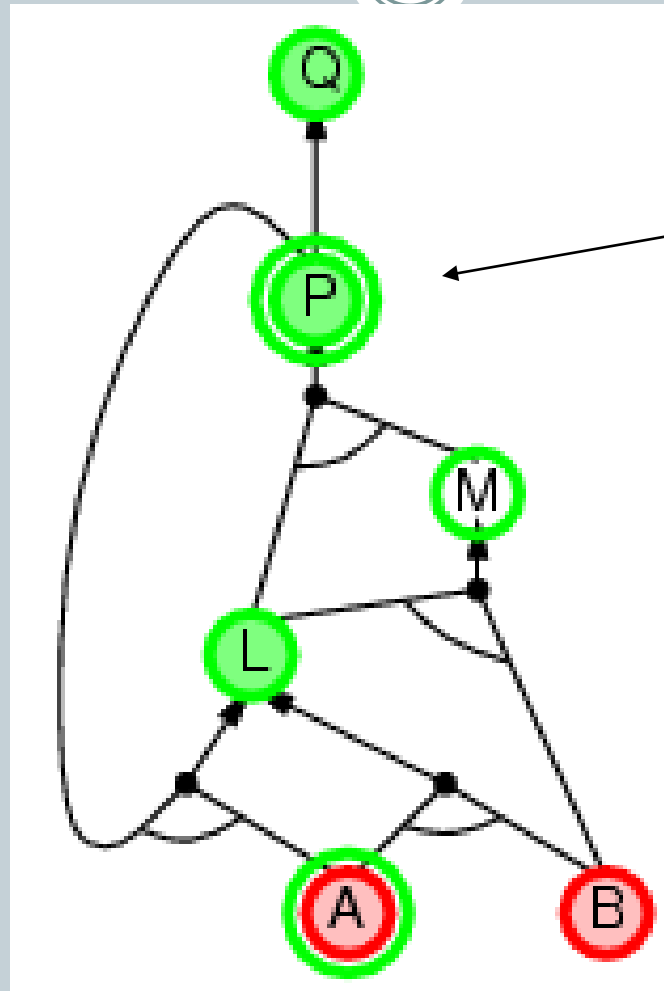

# Backward chaining example

# Backward chaining example

# Backward chaining example

we need P to prove L and L to prove P.

# Backward chaining example

# Backward chaining example

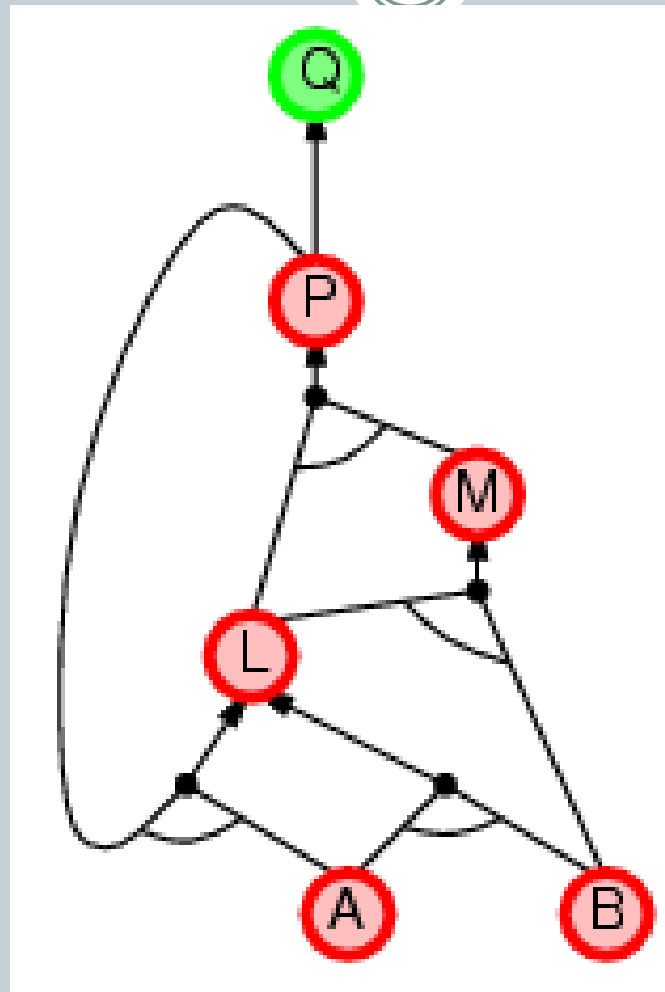

# Backward chaining example

# Backward chaining example

# Backward chaining example

# Backward chaining example

# Backward chaining

- BC is **goal-driven**, appropriate for problem-solving,
  - e.g., Where are my keys? How do I get into a PhD program?
- Complexity of BC can be **much less** than linear in size of KB

Avoid loops: check if new sub-goal is already on the goal stack

Avoid repeated work: check if new sub-goal

1. has already been proved true, or
2. has already failed

Like FC, is linear and is also sound and complete (for Horn KB)

# Model Checking

Two families of efficient algorithms:

- Complete backtracking search algorithms: DPLL algorithm
- Incomplete local search algorithms
  - WalkSAT algorithm

# Satisfiability problems

- Consider a CNF sentence, e.g.,

$$(\neg D \vee \neg B \vee C) \wedge (B \vee \neg A \vee \neg C) \wedge (\neg C \vee \neg B \vee E) \wedge (E \vee \neg D \vee B) \wedge (B \vee E \vee \neg C)$$

*Satisfiability: Is there a model consistent with this sentence?*

$$[A \vee B] \wedge [\neg B \vee \neg C] \wedge [A \vee C] \wedge [\neg D] \wedge [\neg D \vee \neg A]$$

# The WalkSAT algorithm

- Incomplete, local search algorithm
  - Begin with a random assignment of values to symbols
  - Each iteration: pick an unsatisfied clause
    - ✦ Flip the symbol that maximizes number of satisfied clauses, OR
    - ✦ Flip a symbol in the clause randomly
- Trades-off greediness and randomness
- Many variations of this idea
- If it returns failure (after some number of tries) we cannot tell whether the sentence is unsatisfiable or whether we have not searched long enough
  - If max-flips = infinity, and sentence is unsatisfiable, algorithm never terminates!
- Typically most useful when we expect a solution to exist

# Pseudocode for WalkSAT

**function** WALKSAT(*clauses*, *p*, *max-flips*) **returns** a satisfying model or *failure*

**inputs:** *clauses*, a set of clauses in propositional logic

*p*, the probability of choosing to do a “random walk” move

*max-flips*, number of flips allowed before giving up

*model* ← a random assignment of *true/false* to the symbols in *clauses*

**for** *i* = 1 **to** *max-flips* **do**

**if** *model* satisfies *clauses* **then return** *model*

*clause* ← a randomly selected clause from *clauses* that is false in *model*

**with probability** *p* flip the value in *model* of a randomly selected symbol  
    from *clause*

**else** flip whichever symbol in *clause* maximizes the number of satisfied clauses

**return** *failure*

# Hard satisfiability problems

- Consider *random* 3-CNF sentences. e.g.,  
 $(\neg D \vee \neg B \vee C) \wedge (B \vee \neg A \vee \neg C) \wedge (\neg C \vee \neg B \vee E) \wedge$   
 $(E \vee \neg D \vee B) \wedge (B \vee E \vee \neg C)$

$m$  = number of clauses (5)

$n$  = number of symbols (5)

- Underconstrained problems:
  - ✦ Relatively few clauses constraining the variables
  - ✦ Tend to be easy
  - ✦ 16 of 32 possible assignments above are solutions
    - (so 2 random guesses will work on average)

# Hard satisfiability problems

- **What makes a problem hard?**
  - Increase the number of clauses while keeping the number of symbols fixed
  - Problem is more constrained, fewer solutions
  
- Investigate experimentally....

# P(satisfiable) for random 3-CNF sentences, $n$

$= 50$

# Run-time for DPLL and WalkSAT

- Median runtime for 100 **satisfiable** random 3-CNF sentences,  $n = 50$

# Inference-based agents in the wumpus world

A wumpus-world agent using propositional logic:

$\neg P_{1,1}$  (no pit in square [1,1])

$\neg W_{1,1}$  (no Wumpus in square [1,1])

$B_{x,y} \Leftrightarrow (P_{x,y+1} \vee P_{x,y-1} \vee P_{x+1,y} \vee P_{x-1,y})$  (Breeze next to Pit)

$S_{x,y} \Leftrightarrow (W_{x,y+1} \vee W_{x,y-1} \vee W_{x+1,y} \vee W_{x-1,y})$  (stench next to Wumpus)

$W_{1,1} \vee W_{1,2} \vee \dots \vee W_{4,4}$  (at least 1 Wumpus)

$\neg W_{1,1} \vee \neg W_{1,2}$  (at most 1 Wumpus)

$\neg W_{1,1} \vee \neg W_{8,9}$

...

$\Rightarrow$  64 distinct proposition symbols, 155 sentences

# Limited expressiveness of propositional logic

- KB contains "physics" sentences for every single square
- For every time  $t$  and every location  $[x,y]$ ,  
 $L_{x,y} \wedge \textit{FacingRight}^t \wedge \textit{Forward}^t \Rightarrow L_{x+1,y}$
- Rapid proliferation of clauses.

First order logic is designed to deal with this through the introduction of variables.

# Summary

- Logical agents apply inference to a knowledge base to derive new information and make decisions
- Basic concepts of logic:
  - syntax: formal structure of sentences
  - semantics: truth of sentences wrt models
  - entailment: necessary truth of one sentence given another
  - inference: deriving sentences from other sentences
  - soundness: derivations produce only entailed sentences
  - completeness: derivations can produce all entailed sentences
- Resolution is complete for propositional logic
- Forward, backward chaining are linear-time, complete for Horn clauses
- Propositional logic lacks expressive power
