

Homework 8, Solutions, Nov 2024

(1) Joel Friedman

(2) There are many possible solutions.

Note: If we see $\boxed{0}$ in the initial state, q_0 , we can simply write a 1 there and we are done (after, moving right and left). (Since we don't allow leading 0's.)

So we go the initial state, we set

$$\delta(q_0, 0) = (q_{\text{saw leading zero}}, 1, R)$$

$$\delta(q_{\text{saw leading zero}}, \sqcup) = (q_{\text{accept}}, \sqcup, L)$$

we brings us to $\boxed{\sqcup \sqcup \sqcup \sqcup \dots}$

If initially we see

We can mark this cell as the first 1, and move to the end of the input. Adding a symbol \dot{i} to Γ , we write

$$\delta(q_0, 1) = (q_{\text{move to end}}, \dot{i}, R)$$

and

$$\delta(q_{\text{move to end}}, 1) = (q_{\text{move to end}}, 1, R)$$

$$\delta(q_{\text{move to end}}, 0) = (q_{\text{move to end}}, 0, R)$$

We wind up at something like

→ 3 ←

When we see a \sqcup in state $q_{\text{move to end}}$

we move left to the first 0

change the 0 to a 1 , and change all 1 's to the right to 0 's. Hence

$$\delta(q_{\text{move to end}}, \sqcup) = (q_{\text{move left}}, \sqcup, L)$$

$$\delta(q_{\text{move left}}, 1) = (q_{\text{move left}}, 1, L)$$

$$\delta(q_{\text{move left}}, 0) = (q_{\text{swap 1's to 0's}}, 1, R)$$

$$\delta(q_{\text{swap 1's to 0's}}, 1) = (q_{\text{swap 1's to 0's}}, 0, R)$$

$$\delta(q_{\text{swap 1's to 0's}}, \sqcup) = (q_{\text{almost done}}, \sqcup, L)$$

In the "almost done" state we have added one to the counter and have taken a first step to the right

Now we just move to the left and change the i to a 1 :

$$\delta(q_{\text{almost done}}, 0) = (q_{\text{almost done}}, 0, L)$$

$$\delta(q_{\text{almost done}}, 1) = (q_{\text{almost done}}, 1, L)$$

$$\delta(q_{\text{almost done}}, i) = (q_{\text{saw } i}, 1, R)$$

$$\delta(q_{\text{saw } i}, x) = (q_{\text{accept}}, x, L)$$

for $x = 0, 1$

- 5 -

The only exception is something like

where there are no 0's in the counter. In this case we are in

state $q_{\text{move left}}$ (see page 3), but

we see a i symbol. In this

case we enter $q_{\text{only 1's}}$, via

$$\delta(q_{\text{move left}}, i) = (q_{\text{only 1's}}, i, R)$$

(leaving i , i.e. the marked 1, on the

first tape cell, and change

all the 1's to 0's, and add

an extra 0 to the end. Hence
we set

$$\delta(q_{\text{only 1's}}, 1) = (q_{\text{only 1's}}, 0, R)$$

when we see a \sqcup , we make this a
0, and then move left to \uparrow and
replace it by a 1, as before. Hence
we set

$$\delta(q_{\text{only 1's}}, \sqcup) = (q_{\text{almost done}}, 0, L)$$
